

I2C GPIO PULLUP

What is the resistance value of the internal pull-up and pull-down of GPIO of ESP-WROOM-32? please tell me.

It's not a really precise value (because that is hard to do with resistors in silicon) but you can assume it's something between 10K and 100K. internally we use 50K as a go-to value, I think.

thank you very much. it was very helpful.
